The use of new information and communication technologies by organised crime and terrorist groups is a key challenge for policy-makers and Law Enforcement Agencies (LEAs). Earlier and better knowledge and intelligence are required to be able to act sooner. For this purpose, COPKIT proposes an **intelligence-led Early Warning (EW) / Early Action (EA) system** for both strategic and operational levels.

Our objectives

Apply new EW/EA-led policing technologies for improved situational awareness

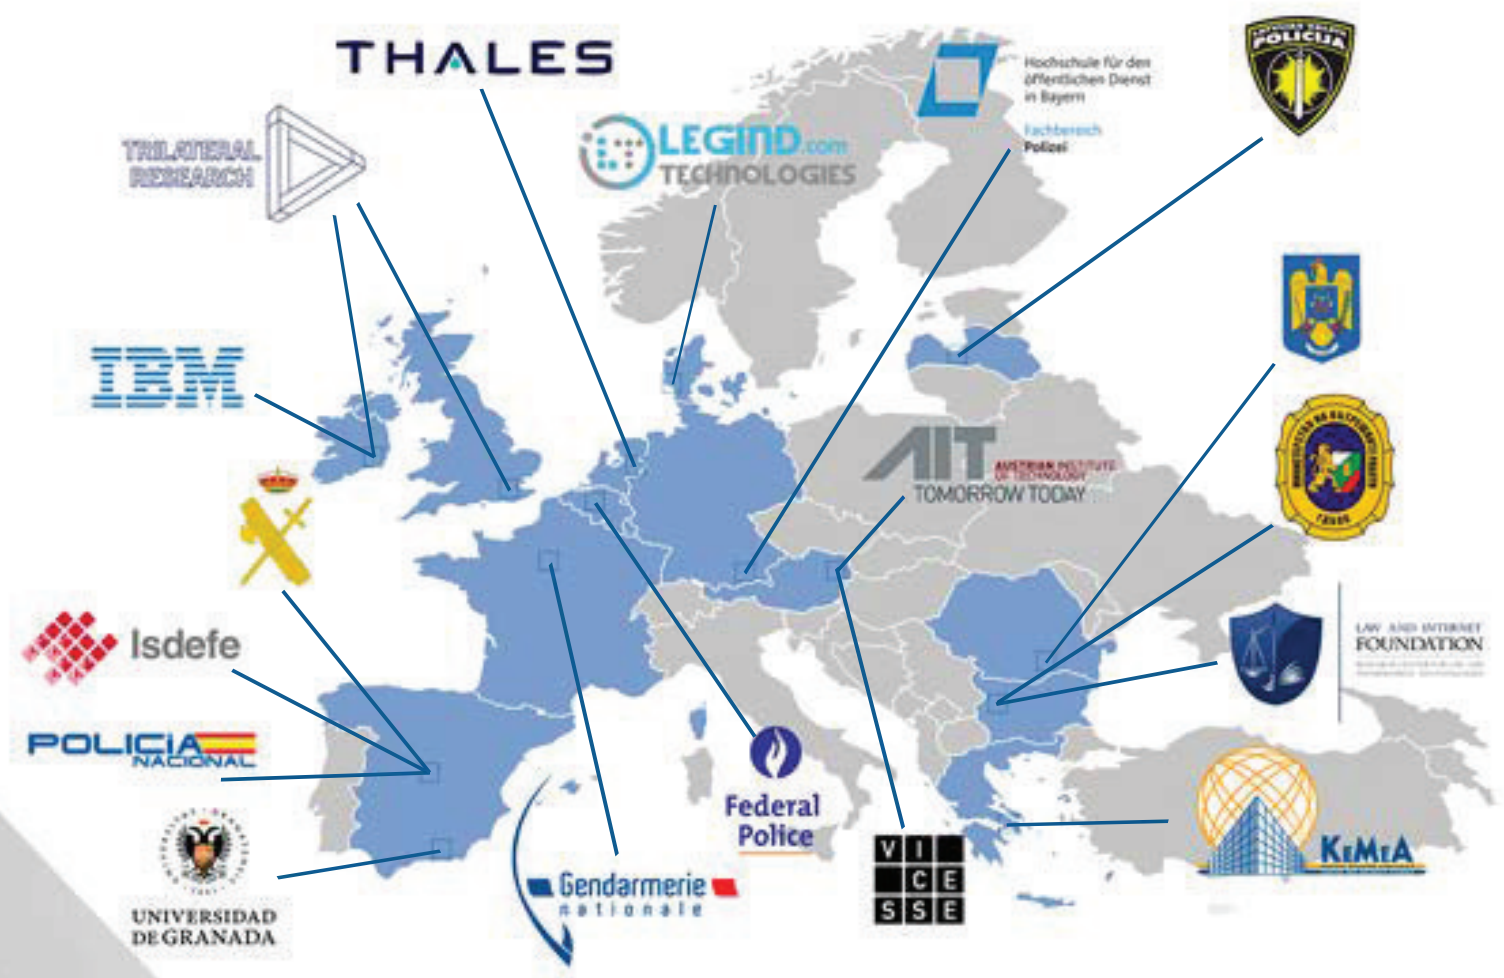

Develop a toolkit for knowledge production and exploitation in investigative and strategic analysis work to support the EW/EA paradigm

Ensure that the new tools, detection capabilities and knowledge-sharing respect EU data protection regulation and ethical principles

Develop innovative curricula for educating and training LEAs for the methodological and workflow aspects of EW/EA-led policing

COPKIT project is co-ordinated by Isdefe, which is a state-owned company property of the Spanish Ministry of Defence. The consortium is made up of 18 partners from 13 countries with different profiles and expertise in several domains, including law enforcement agencies, industry, academia and research and technology organisations.
